Cello Products was founded in 1946 in Cambridge, Ontario as a manufacturer of cast brass solder fittings. Wrought copper solder fittings were added to the product line in the 1960's; today, Cello is 100% Canadian owned and produces an extensive line of wrought copper and cast brass solder fittings, in sizes ranging from 1/8" to 8". Cello manufactures five general types of solder fittings: Wrought Copper Pressure, Cast Brass Pressure, Wrought Copper Drainage, Cast Brass Drainage, and Cast Brass Flanges. Cast brass solder fittings are made for both soft solder joining systems and silver braze joining systems. Cello also manufactures a portion of its cast threaded brass product line and does custom casting for special order fittings not shown in this catalogue.

Our products are used in plumbing, heating and related mechanical applications. Cello produces fittings ranging in use from underground water and gas services to water distribution and air conditioning systems as well as drainage, waste and vent piping for use in residential, commercial, industrial and institutional applications.

Cello is the only full-line copper solder fittings manufacturer in Canada and is also one of only two full-line solder fittings manufacturers in North America.

Cello Products' fittings are made from the highest quality raw materials available. Modern production techniques are used to ensure consistency and quality in our fittings. Cello employs fully automatic computer numeric controlled (CNC) lathes in its operations, and a large quantity of finishing machines are controlled with programmable logic controllers. Certain pieces of equipment have been commissioned with state-of-the-art computer controlled multi-axis positional controllers. Qualified personnel inspect and test our products to ensure that only the finest quality products are shipped to our customers. Cello's care in the design and production of all our products is exemplified in both our cast brass and wrought copper fittings. Cello fittings are produced to meet requirements of all applicable standards wherever practicable. Our facility is ISO 9002 certified, and we are currently working toward ISO-9001:2000 certification which will be achieved December 2003. All pressure fittings manufactured by Cello Products have CRNs (Canadian Registration Numbers) in accordance with CSA B51-95 Boiler, Pressure Vessel and Pressure Piping Code.

All manufacturing is done in a 85,000 sq. ft. building located in Cambridge, Ontario which is ideally situated to serve the Canadian and United States' markets. Cello's products are shipped to our customers in North America from six warehouse locations to better serve our customers.

Ordering Information

WHERE TO ORDER:

Cello Products' fittings are available only through wholesalers and distributors engaged in the distribution of flow products to the plumbing and heating industry. All orders are placed through our inside sales desks at 210 Avenue Road, P.O. Box 37, Cambridge, Ontario, N1R 5S9 either by mail, phone (1-519-621-9150, toll free 1-800-265-7882), fax (1-519-621-4108), or e-mail us at: cello@cello.on.ca

HOW TO ORDER:

State quantity, part number and size for each fitting you wish to order. See individual catalogue pages for specific product designations. Cello's part number contains a prefix indicating the fitting type and a suffix that identifies the size. Part numbers identifying the fitting type are listed in this catalogue with the part name and description. When ordering, identify the part number and add the size code after the hyphen. Size codes are based on 1/16 inch increments. Thus, a 1/8" fitting would have a size code of 02. A 1" fitting would be identified by size code 16, while a 2½" fitting is identified by the size code 40 (2.5 x 16).

DELAYS:

All orders are accepted under the understanding that we are not responsible for delays caused by circumstances beyond our control, such as fires, floods, accidents, strikes or delays by third party transportation.

WARRANTY:

Cello Products Inc. warrants that all fittings provided by it will be free from defects in materials and manufacture that will impair their utility, provided they are used intended. Any fitting that proves to be defective will be replaced or a credit issued but no labour charges, expenses or damages will be allowed.

DIMENSIONS:

We have included roughing-in dimensions in this catalogue. These dimensions are provided with the latest information available at time of publication and are for estimating purposes only.

PACKAGING:

Cello fittings are packaged in master cartons with easy to read, bar coded labels for ease of handling and identification. Box or bag quantities are shown in the catalogue next to each item.

NET WEIGHTS:

Approximate net weights in pounds are shown for each item in the catalogue to assist in estimating the weight of shipments to meet the terms for freight allowance (**freight prepaid for single shipments of 500 lbs or more**).

SIZES:

Unless otherwise specifically stated, all copper end sizes shown in this catalogue are nominal tube sizes. For those accustomed to dealing in outside diameter tube sizes, the nominal size of a fitting is always 1/8" less than the actual outside diameter size of the tube to be used with it. O.D. sizes are shown in some cases and are 1/8" larger than nominal.

RETURN GOODS:

A minimum 25% restocking charge will apply to all goods returned, not due to defects in materials, construction, or shipping errors. No returns will be accepted without prior authorization and all goods must be in resaleable condition.

SPECIAL CLEANING FOR OXYGEN SYSTEMS:

Degreasing of fittings to be used in oxygen systems is available.

SPECIAL END CUPS:

Cast Solder fittings used in silver brazed systems require special cup lengths which are available for all Cello cast fittings.

Cello Products Inc reserves the right to modify packaging and product design at any time. Information in this catalogue is correct to the best of our knowledge. Cello Products Inc. assumes no responsibility for any changes or errors. If there are any questions, please contact customer service.

Wrot Fittings for Oxygen and Medical Gas Services

Cello Products Incorporated supplies "Cleaned and Degreased" wrot copper fittings for use in Oxygen and Medical Gas Services. The Purpose of cleaning and bagging is to assure that the fittings are free of carbon based contaminants, and that they remain that way until they reach the job site. The methods used in providing these parts are listed below:

- 1.) Presoak is used to remove any surface oils, soaps or dust which adhere to the parts surface as a result of the manufacturing process. Presoak is a non alkaline based compound, heated to a temperature of 160 degrees Fahrenheit. All fittings are barrel rolled in the presoak solution for a period of time calculated in accordance with the load, in order to insure a thorough cleaning of parts.
- 2.) The non alkaline cleaner is a mixture of Caustic Soda, Sodium tripolyphosphate, Sodium Silicate, and Sodium Lignosulphate in combination with proprietary surfactants.
- 3.) The parts are then thoroughly rinsed in a clear cold water bath and then immersed in a cleaning solution of Craft CPB30, Ferric sulfate and Sulphuric Acid.
- 4.) The parts are then blown dry, and packaged in FDA approved polypropylene bagging to insure the integrity of the parts and to prevent contamination from handling.
- 5.) The overall process is designed to produce parts which conform to NFPA 56F, NFPA 99C and ASTM B819 standards for cleanliness. These parts are then of a quality to be used in Oxygen and Medical Gas service systems.
- 6.) Ongoing quality tests and documentation are a standard part of Cello's quality control process, and of our ISO 9002 certification.

Clean and Bag (Degreased)

Product Specification:

Cello Products Inc. certifies that it manufactures all its cast brass and wrought copper solder joint fittings to the general specifications outlined in the following industry standards:

<i>Wrought Copper and Copper Alloy Solder Joint Pressure Fittings:</i>	ASME/ANSI Std. B16.22 - 2001
<i>Cast Copper Alloy Solder Joint Pressure Fittings:</i>	ASME/ANSI Std. B16.18 - 2001
<i>Wrought Copper and Wrought Copper Alloy Solder Joint Drainage Fittings -- DWV</i>	ASME/ANSI Std. B16.29 - 2001
<i>Cast Copper Alloy Solder Joint Drainage Fittings:</i>	ASME/ANSI Std. B16.23 - 2002
<i>Bronze Pipe Flanges and Flanged Fittings:</i>	ASME/ANSI Std. B16.24 - 2001
<i>Cast Bronze Threaded Fittings:</i>	ASME/ANSI Std. B16.15 - 1985
<i>Wrought Copper and Copper Alloy Braze - Joint Pressure Fitting</i>	ASME/ANSI Std. B16.50 - 2001
<i>Cast Copper Alloy Pipe Flanges and Flanged Fittings</i>	ASME/ANSI Std. B16.24 - 2001
<i>Wrought Copper LW Solder Joint Pressure Fittings:</i>	MSS SP-104 - 1990
<i>Cast Copper Alloy Flanges and Flanged Fittings Class 125, 150, 300:</i>	MSS SP-106 - 1990

Cello further certifies that the materials used to manufacture these fittings are made in compliance with the following industry standards:

Tubular Wrought Copper:

<i>Standard Specification for Seamless Copper Tube:</i>	ASTM B75 Alloy C12200
---	-----------------------

Products Made From Sheet:

<i>Standard Specification for Copper Sheet, Strip, Plate and Rolled Bar:</i>	ASTM B152 Alloy C11000
--	------------------------

Cast Products:

<i>Standard Specification for Copper Alloy Sand Castings for General Applications; Federal Specification WW-U-516 for Type III, Class A and B Copper Alloy Unions:</i>	ASTM B584 Alloy C84400
--	------------------------

The industry standards are: ANSI (American National Standards Institute); ASME (The American Society of Mechanical Engineers); MSS (Manufacturers Standardization Society of the Valve and Fittings Industry Inc.); ASTM (American Society for Testing and Materials).

All Cello Products Inc. wrought copper fittings are NSF 61 registered.

All pressure fittings manufactured by Cello Products Inc. have Canadian Registration Numbers (CRN)

0A4925.5C Pressure pipe fittings

0B4925.5C Flanges

(note - the 5 is needed to designate the first province of registration)

International Quality Standard: Cello Products is certified to ISO 9002 standards through QMI (Quality Management Institute) and will be certified to ISO 9001:2000, by 2004.

bare hands or oily gloves. Skin oils, lubricating oils and grease impair solder flow and wetting of the metal surfaces.

Temperature Ranges

The choice for soldering or brazing will depend upon operating conditions. Solder joints are generally used where the system temperatures do not exceed 250° F and brazed joints can be used where greater strengths are required (ie. high internal pressure), or where system temperatures are as high as 350° F.

Soldering

Applying flux (a non-aggressive soldering flux) is recommended. Stir the flux before use. Flux is designed to remove residual oxides from the surfaces to be joined, protect the surfaces from re-oxidation during heating and promote the wetting of the surfaces by the liquid solder. A thin, even coating of flux should be applied with a brush to both tube and fitting. The use of fingers to apply flux should be avoided as chemicals in the flux can be harmful if carried to the eyes or open cuts.

Types of solder -- There are a variety of solders available that will produce sound, leak-tight joints. Solders that are used for piping applications generally contain tin and varying amounts of either antimony, copper, lead or silver. For potable water systems, solders which do not contain lead are mandatory.

Assembly -- After both surfaces are properly cleaned and fluxed, they should be assembled by placing the fitting on the tube, making sure the tube seats against the base of the fitting socket. A slight twisting motion is suggested to ensure even coverage by the flux. Remove the excess flux with a rag. Because of the heat that is required during soldering and brazing, only cotton rags should be used. Complete all prepared joints within a single work day. Care must be taken to assure that the tube and fittings are properly supported with a uniform capillary space around the entire circumference of the joint. Uniformity of capillary space will ensure good filler metal penetration if the guidelines of successful joint making are followed. Excessive joint clearance can cause the filler metal to crack under stress or vibration.

Heating -- Because of the open flame and high temperatures required for soldering and the flammability of the gases used, safety precautions must be observed. The heat is generally applied by use of an air/fuel torch. These torches can use acetylene or a variety of LP gases. Electric resistance pliers can also be used.

Heating should begin with the flame perpendicular to the tube. This preheat will conduct the initial heat into the socket for even distribution of heat inside and out. Preheating time depends upon the diameter of the joint -- experience will indicate the proper amount of time. Next, move the flame onto the fitting socket then alternate the flame from the fitting socket back onto the tube a distance equal to the fitting socket. Touch the solder to the joint. If the solder does not melt, remove it and continue the heating process. Be careful not to overheat or direct the flame into the fitting socket. This action can cause the flux to burn and destroy its effectiveness. When the melting temperature has been reached, heat may be applied to the base of the socket to aid capillary action in drawing the solder into the socket.

Applying Solder -- When the tube is in a horizontal position, start applying the solder slightly off-center of the bottom of the joint. Proceed across the bottom of the fitting and up to the top-centre position. Return

to the point of beginning, overlap the starting point and then proceed up the uncompleted side to the top. Again, overlapping the solder. Molten solder will be drawn into the joint by capillary action regardless if the solder is being fed upward, downward or horizontally.

Cooling and Cleaning -- After the joint has been made, natural cooling is best. Shock cooling may cause unnecessary stresses on the joint and may result in eventual failure. Once the fitting is cool, clean off any remaining flux with a wet rag.

Brazing

Applying Flux -- The fluxes used for brazing copper joints are different in composition from soldering fluxes. They cannot, and should not, be used interchangeably.

Brazing fluxes are water based. Similar to soldering fluxes, brazing fluxes remove residual oxides from the metal surfaces; they protect the metal surfaces from re-oxidation during heating and they promote the wetting of the surfaces to be joined by the brazing filler metal. Application of the flux is the same as when soldering. If the outside of the fitting and the heat affected area of the tube are covered with flux, it will prevent oxidation and greatly improve the appearance of the joint.

Brazing Filler Materials -- There are two general types of brazing filler metals used for joining copper tube: BCuP (Brazing - Copper - Phosphorous) and BAg (Brazing - Silver). These brazing filler metals are classified according to their components.

BCuP filler metals are preferred for joining copper tube and fittings. The phosphorous in these filler metals acts as a fluxing agent and the lower percentage of silver makes them relatively low cost filler metals. When using copper tube, wrought copper fittings and BCuP brazing filler metal, fluxing is an option due to the self-fluxing action of the phosphorous present in all components of the brazed joint.

The choice of brazing filler metals depends upon four main factors:

- dimensional tolerance of the joint
- type and material of fitting (cast or wrought)
- desired appearance
- cost

Heating -- Oxy/fuel torches are generally used when brazing because of the higher temperatures required. Due to recent innovations in air/fuel torch tip design, they can now be used on a wider variety of sizes for soldering and brazing.

When working with temperatures this high, safety precautions must be followed and care taken to protect both the operator and the materials being used.

The heating operation is the same as for soldering. First preheat the tube and then the tube and fitting socket. When the brazing filler metal starts to melt, apply the heat at the base of the fitting socket to help draw the brazing filler metal in by capillary action.

Applying Brazing Filler Metal -- Remember to allow the heat of the joint to melt the filler metal. Do not melt the filler metal with the torch. The melted filler metal will be drawn into the joint by capillary action. It is very important that the flame be in continuous motion and should not be allowed to remain on any one point long enough to burn through the tube or fitting. When the joint is complete, a continuous filler should be visible completely around the joint. If the filler metal fails to flow or has the tendency to ball-up, it indicates oxidation on the metal surfaces or insufficient heat on the parts to be joined. If the filler metal refuses to
